

ABSTRACT OF THE DISCLOSURE

TEST DEVICE

5 A test device for testing of analyte concentration in a
fluid comprises: a housing (2) having an opening and
containing a stack of sensors (16); a transport member (4)
rotatably mounted in the opening of the housing, having an
axis of rotation which spans the opening; a spring (24)
10 which urges the stack against the transport member; and
sealing means (20, 34) for making a moisture tight seal
between the transport member and the sensors when the
transport member is in a specified rotational position.
An outer surface of the transport member has a recessed
15 region (12) which is adapted to receive a single sensor
from the stack. Rotation of the transport member with a
sensor in the recessed region transports the sensor to a
location where it can be connected to a meter (6, 8) and
receive a drop of fluid to be tested.
